                                           A substantially pure TIAP polypeptide (I), a member of IAP (inhibitor of apoptosis) family of proteins that is expressed in the testes. (I) is apoptosis of inclination of apoptosis and accompound that modulates TIAP biological activity (I) is useful for increasing apoptosis in a cell, preferably a germ-line cell and for increasing fertility in an animal. (I) is useful for treating apoptosis which occurs as a part of testicular cancer and male infertility. TIAP may be manipulated for use as a male birth control. TIAP polypeptides and nucleic acid sequences also have abarrant levels of apoptosis. The present sequence represents the coding sequence of X-linked inhibitor of apoptosis (XIAP)
                                                                                                                                                                                                                                                                                                             120

                method for screening a substance inhibiting the formation of a complex between XIAP and TABI, in which X-linked inhibitor of apoptosis protein (XIAP), transforming growth factor-beta activated kinase I (TAKI) binding protein 1 (TABI) and a substance to be tested are contacted with each other and then the presence to formation of a complex between XIAP and TABI is detected. The substance can be used as a drug for extracellular matrix protein production enhancement, cell growth inhibition, monocyte migration, physiologically active substance induction immunosuppression, and beta-amyloid protein deposition. A substance inhibiting the formation of a complex between TABI and XIAP as well as between XIAP and TGF-beta (Transforming growth factor-beta) type I and/or type II receptor is

                           The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnostics and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, correctly and paramacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding carray can detect changes in expression in a large number of genes coding various diseases including cancer e.g. adenocarcinoma and leukaemia.

Immunopathies e.g. AIDS and aschma, neuropathies e.g. Alzheimer's disease including cancer e.g. adenocarcinoma and leukaemia.

Immunopathies e.g. AIDS and aschma, neuropathies e.g. Alzheimer's disease to brobe of the invention. Note: The sequence data for this patent did not formal directly from USPTO at the printed specification but was obtained in electronic format directly the printed specification but was obtained in electronic

The invention relates to a composition of polynuclectide probes comprising itst polynuclectide probes comprising at least a portion of a gene encoding a receptor-like polypeptide, second polynuclectide probes comprising at least a portion of a gene encoding an effector-like polypeptide. The probes of the polypeptide and third polynuclectide probes comprising at least a portion of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polynuclectides. The microarray is useful in the camposition are useful as array elements in a microarray for monitoring the expression of target polynuclectides. The microarray is useful in the neuropathology. It can also be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or plarmacogenomics. That may be associated with the altered expression of diseases that may be associated with the altered expression of diseases that may be associated with the altered expression of gignalling pathway polypeptides. The composition can also be used to purify a subpopulation of mRNAs, cDNAs, cDNAs, cDNAs, cDNAs, cDNAs, cDNAs, cDNAs, or genomic fragments in a sample. The expression profile is also useful for the diagnosis and treatment of cancer, e.g. cancers of the adrenal gland, bladder, bone, hone marrow, brain, breast or cervix, culcarative colitis, or a neuropathology, e.g. dementia, annessia, epilepsy, Alzheimer's disease or depression. This sequence represents a human polynucleotide proper of the invention. Note: The sequence data for this parent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The invention relates to a transgenic fly whose genome comprises DNA percoding a polypeptide having the Abeta portion of human amyloid precursor protein (APP), fused to a signal sequence. The DNA sequence encodes a 123 (Abeta42) amino acid sequence. The DNA sequence is operably linked to a tissuespecific expression control sequence. Expression of the sequence gives the fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent is a compound, triple helix DNA, antisense oligonuclectide, double stranded RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheimer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This polynuclectide sequence represents the DNA of the APP related human homologue hCP35211
Neuroprotective; nootropic; transgenic fly; Alzheimer's disease; Abeta; amyloid precursor protein; tissue-specific expression control; human APP; APP pathway modulator; gene therapy; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New transgenic fly, containing DNA encoding an Abeta portion of human APP, useful for identifying agents which modulate the APP pathway and which can be used to treat Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                  /product= "Protein of human homologue hCP35211"

The xiap gene (for X-linked IAP gene) was isolated from a human foetal brain ZapII cDNA library using an X-linked sequence tag site that shows strong homology with the conserved ring zinc finger domain of baculovirus CDIAP and OpIAP genes. The gene was assigned to chromosome Xq25 by RISH. IAP nucleic acids can be used to express IAP polypeptides in cells and animals to inhibit apoptosis, and as primers and probes to identify and isolate additional IAP genes, as well as in methods for treating diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           885

The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (I) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAPI or HIAPI. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method of enhancing apoptosis in a cell, comprising administering a negative regularor of the IAP anti-apoptotic pathway to the cell. The IAP antisense inhibitor is useful for enhancing apoptosis in a cell in a mammal diagnosed with a proliferative disease. The method is useful for treating a patient diagnosed with a proliferative disease like cancer. The IAP antisense molecule is useful to treat, ameliorate, improve, subtain or prevent proliferative diseases (e.g. ovarian cancer.) adenocarcinoma, lymphoma, pancreatic cancer,) and also in diseases or continuous where apoptosis is involved or implicated (e.g. embryonic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to antisense oligonucleotides designed to inhibit expression of the human X-linked inhibitor of apoptosis. The present sequence is the X-linked inhibitor of apoptosis DNA, Modified phosphorothioate 2'-methoxyethyl (2'-MOE) oligonucleotides are more effective inhibitors than unmodified oligonucleotides. The oligonucleotides may be used to inhibit X-linked inhibitor of apoptosis expression in cells and tissues in vtro. The oligonucleotides are also useful for treating animals or humans, prone to a disease associated with X-linked inhibitor of apoptosis. The oligonucleotides may also be used prophylactically to prevent infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense compound useful for research reagents, diagnostics, prophylaxis and for treating disorders associated with X-linked inhibitor of apoptosis, modulates expression of X-linked inhibitor of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   885

                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a polymucleotide library (I) useful in the molecular characterisation of a carcinoma, comprising a pool of polymucleotides or its subsequences which are either underexpressed or verexpressed in tumour cells, and correspond to any of the coverxpressed in tumour cells, and correspond to any of the polymucleotide sequences chosen from the 468 sequences given in ABV94010 ct to ABV94477. Also described: (I) a polymucleotide array (II) useful for the prognosis or diagnostic of tumour, comprising (I); and (2) detecting correlated with a cancer, involves obtaining a polymucleotide sample from a patient, and reacting the polymucleotide sample obtained with a probe comprise on a solid support, where the probe comprises any combination of the polymucleotide sequences of (I), and detecting the reaction product.

(I) have cytostatic activities and can be used as anti-tumour agents. (I) is useful in molecular characterisation of a carcinoma. (I) are cuseful for the prognosis or diagnostic of tumour, in differentiating a normal cell from a cancer cell, detecting a hormone sensitive tumour

lymph nodes, differentiating antracycline-sensitive tumours from antracycline-insensitive tumours, and classifying good and poor prognosis primary breast tumours. (I) is useful for large-scale molecular characterisation of breast cancer that help in prediction, prognosis and cancer treatment, and for detecting differentially expressed genes that correlated with a cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying a test compound that binds to a target RNA molecule by separating the detectably labeled target RNA:support-attached test compound complex from uncomplexed target RNA molecules and test compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel method for identifying a test compound that binds to a target RNA molecule comprising separating the detectably labeled target RNA:support-attached test compound complex from uncomplexed target RNA molecules and test compounds. The separating process is carried out by flow cytometry and determining a structure of the type of test compound of the RNA:support-attached test compound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              flow cytometry;

Identifying a test compound that binds to a target RNA molecule for treating or preventing amyloidosis, hemophilia, cancer, gigantism, diabetes, by contacting a detectably labeled target RNA molecule with a test compounds library of

Example; Page 88-89; 152pp; English.

The invention relates to a method for identifying a test compound that binds to a target RNA molecule, which comprises contacting a detectably labelled target RNA molecule with a library of test compounds under conditions that permit direct binding of the labelled target RNA to a member of the library of test compounds so that a detectably labeled

```
target RNA:test compound complex is formed. The method is useful for screening libraries of compounds for those that are selectively bind to a pre-selected target RNA. The compounds are useful for inhibiting the formation of a specific bound RNA:host cell factor complexes in vivo. They are also useful for treating or preventing diseases associated with overproduction or decreased protein function, such as amyloidosis, haemophilia, Alzheimer's disease, atherosclerosis, cancer, gigantism, dwarfism, hypothyroidism, hyperthyroidism, autoimmune disorders, aging, inflammation, cystic fibrosis, diabetes, obesity, neurodegenerative disorders, Parkinson's disease or infections (bacterial, viral, fungal). The invention is also used in gene therapy. The present sequence is human X-linked inhibitor of apoptosis protein (XIAP) DNA. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                ö

                                             The invention relates to a novel isolated protein complex comprising a RING-SH 3 polypeptide and a polypeptide selected from a Gag protein, a Gag late domain, P13K, actin, myosin, Hsp60, Hsp70, Hsp90, STAM1, STAM2A, STAM2B, WHS-UHM, a GTPase, an E2 enzyme, tsg101, a cullin, RING-SH, and a clathrin. The novel protein complex has virucide activity and can be used to treat disorders as part of a vaccine. The protein complex and composition are useful for detecting cells infected with a virus, for identifying agents having antivixra activity, and for treating viral disorders caused by retroviruses, rhabdoviruses, or filoviruses. The invention relates to a method of predicting clinical outcome for a patient diagnosed with cancer by determining the expression level of one or more genes, or their expression products, sealected from p53B22, cathepsin B, cathepsin L, Ki67/MiB1, and thymidine Kinase in a cancer tissue obtained from the patient, normalized against control gene(s), and compared to the amount found in a reference cancer tissue set. The specification also discloses an array comprising polynuclecides (bybridizing to the following genes: FOXMI, PRAME, B612, STKIS, CEGFI, Ki-CT GSTMI, CA9, PR, BBC3, NMEI, STW, GATA3, TFRC, YB-1, DFYD, GSTM3, RPS6KB1, Sro, ChNI, IDI, ESKHI, p27, CCNBI, XIAP, CHK2, CDC25B, IGFIR, AXO55699, PI3XC2A, TGFB3, BAG11, CYP3A4, BCPCAM, VEGFC, p52, HBW1, TFSI, HSPP1, HTRIA, IGFBP3, CTSB, HAPZ and DIABHO, immobilized on a solid surface. The methods are useful for predicting clinical outcome for a patient diagnosed with invasive breast cancer on with estrogen receptor (ER) clinelihood of long-term survival of a breast cancer or with estrogen receptor (ER) clinelihood of long-term survival of a breast cancer or with estrogen receptor (ER) clinelihood of long-term survival of a breast cancer or with estrogen receptor (ER) clinelihood of long-term survival of a breast cancer or with estrogen receptor (ER) constitute invasive breast cancer or with estrogen receptor (ER) constitute invasive breast cancer or with estrogen receptor (ER) constitute invasive breast cancer or with estrogen receptor (ER) constitute invasive breast cancer or with estrogen receptor (ER)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under conditions to form one or more hybridisation complexes and comparing the levels of the detected thybridisation complexes with the level of hybridisation complexes or relates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a method for identifying a plurality of polynucleotide probes. The cDNAs the diagnosis of an immunopathology, such as Crohn's disease, asthma, contentifying agents for the treatment of the diseases. The microarray may also be used in drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. The composition may also be used in purification of a subpopulation of mRNAS, cDNAS or invention Note. The sequence represents a human cDNA of them
                                                                                                      A composition comprising a plurality of cDNAs, useful for detecting altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ention. Note: The sequence data for this patent did not form part of printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           USPTO at segdata.uspto.gov/sequence.html

DNA encoding human XIAP.

Biomarker; prostate neoplastic condition; inhibitor of apoptosis; IAP;

946 GGAGGGCTAACTGATGGAAGCCCAGTGAAGACCCTTGGGAACAACATGCTAAATGGTAT 1005 The present invention relates to a method for identifying a biomarker that is diagnostic for the survival of patient with a prostate neoplastic condition. The method comprises measuring the level of inhibitor of apoptosis (IAP) polypeptide chosen from chosen from XIAP (X chromosomelinked inhibitor of apoptosis), clap1 and clAP2 in a neoplastic prostate cell-containing sample from patients, and identifying correlation between the level of IAPs in the sample, where the correlation of an IAP with survival in the patients indicates IAP as a biomarker diagnostic. The method is useful for the prognosis of prostate neoplastic conditions such as prostate cancer. The method is efficient in determining the prognosis 120 180 826 TATGAAGCACGGATCTTTACTTTTGGGACATGGATATACTCAGTTAACAAGGAGCAGCTT 885 09 Identifying biomarker that is diagnostic for survival of a patient with prostate neoplastic condition by measuring level of integrin associated protein in sample, and identifying correlation of the level in sample. GCAAGAGCTGGATTTTATGCTTTAGGTGAAGGTGATAAAGTAAAGTGCTTTCACTGTGGA 121 GGAGGGCTAACTGATTGGAAGCCCAGTGAAGACCCTTGGGAACAACATGCTAAATGGTAT 1 TATGAAGCACGGATCTTTACTTTTGGGACATGGATATACTCAGTTAACAAGGAGCAGCTT 886 GCAAGAGCTGGATTTTATGCTTTAGGTGAAGGTGATAAAGTAAAGTGCTTTCACTGTGGA while the patient is still at an early stage of disease, and in monitoring the effectiveness of a particular treatment in a prostate neoplastic condition. The present sequence encodes human XIAP. Gaps XIAP; X chromosome-linked inhibitor of apoptosis; cIAP1; cIAP2; prostate cancer; human; gene; ds. 0 100.0%; Score 198; DB 12; Length 2540; 100.0%; Pred. Sequence 3, Application US/09617053A

Patent No. 6300492

GENERAL INFORMATION:

APPLICANT: Korneluk, Robert G

APPLICANT: Liston, Peter

APPLICANT: Bard, Stephen

APPLICANT: Pratt, Christine

APPLICANT: Pratt, Christine

TITLE OF INVENTION: DETECTION AND MODULATION OF IAPS AND

TITLE OF INVENTION: DISEASE

FILE REFERENCE: 07891/009003

CURRENT APPLICATION NUMBER: US/09/617,053A

CURRENT PILING DATE: 2000-07-14

PRIOR APPLICATION NUMBER: US 08/800,929

Clone distribution: MGC clone distribution information can be found through the I.M.AG.B. Consortiun/LinL at: http://image.llnl.gov Series: IRAK Plate: 119 Row: h Column: 2
This clone was selected for full length sequencing because it passed the following selection criteria: marched mRNA gi: 16974127
This clone has the following problem: retained intron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CD350778 173 bp mRNA linear EST 09-JUL-2003

                                                                                       /ctoue="Organ Brain; Vector: pyx- Asc; Site 1: BCOR I; Site 2: Not 1; The library was constructed according Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. Denatured RNA was size fractionated on a 1% agarcse gel. First strand CDNA synthesis was primed with oligo-dT primer containing a Not I site. Double strand CDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with NotI and then cloned directionally into pyx-Asc vector. The library tag sequence located between the Not I site and the polyA tail is AGCGAGACG. This library was created for the University Iowa Brain Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Pervous System', supported by National Institute of Mental Health (NIMH), Hemin Chin, Ph.D.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WIH-MGC Project URL: http://mgc.nci.nih.gov

1 8 ug of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The CDNAs were ligated to Lone-linker LL-Sal4, purified by phenol/Chloroform, and separated from free linkers by Centricon 100. Then, the CDNAs were amplified by long-range high fidelity PCR using Ex Tag polymerase (Takara) with a primer Sal4-S. The products were purified by phenol/Chloroform and Centricon 100. The CDNAs were digested with Sal1 and NotI enzymes and cloned into Sal1/NotI site of pSPORTI plasmid vector. The DH10B E. Coli host was transformed with the ligation mixture by the standard chemical method. The average insert size is about 2.4 kb. The library was constructed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /tissue type="Male genital ridge/mesonephros"
